ASSESSMENT TOOL 3 – CODING CHALLENGE

Course Code:	DSA0304	Course Title:	Natural Language Processing
CO Assessed:	CO1 – Imitation (L1)	Assessment:	Assessment Tool 3 – Coding Challenge
Weightage:	30% of CIA		
CO5 Statement:	Analyse NLP models, regular expression patterns, finite state automata, morphological processing techniques and to interpret language processing. (BL-3)		
Student Name:	G. Akshya	Reg. No.:	192425132
Section / Batch:	Slot B/2024	Date:	05/10/2026

Code of Conduct

I G. Akshya 192425132 certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: G. Akshya

Instructions

- Develop a complete and modular Python program that meets all the functional requirements specified in the coding challenge using appropriate algorithms, data structures, and programming practices.
- Test the program using multiple valid and invalid test cases, and clearly display the input, processing, and output to verify the correctness of the implementation.
- Follow standard coding practices by using meaningful variable names, proper indentation, comments, exception handling (where applicable), and upload the source code, sample outputs, and README file to the designated GitHub repository.
- Duration: 40 minutes.

Section / Topic	Focus	Q Nos
Regular Expression Pattern Matching	Regular Expressions, Basic Regular Expression Patterns	1
Finite State Automata Implementation	Finite State Automata, Models and Algorithms	2
Advanced Regular Expression Search	Regular Expressions, Basic Regular Expression Patterns	3

Annexure A – Coding Challenge

Section 1: Intelligent Email and Password Validator using Regular Expressions

1.Problem Statement:

A software company is developing a user registration system. Before creating an account, the system must validate user credentials based on predefined security policies.

Develop a Python application that validates:

Email Address

Password

Mobile Number

using Regular Expressions.

Validation Rules

Email

Must start with an alphabet.

May contain letters, digits, '.', '_' before '@'.

Domain should contain only alphabets.

Valid extensions: .com, .org, .edu, .net, .in

Password

Minimum 8 characters

At least one uppercase letter

At least one lowercase letter

At least one digit

At least one special character (@, #, \$, %, &, !)

Mobile Number

Must contain exactly 10 digits.

First digit should be between 6–9.

Expected Output

Display:

Valid Email / Invalid Email

Strong Password / Weak Password

Valid Mobile Number / Invalid Mobile Number

Objective: - To develop a Python program using regular expressions to validate email addresses, passwords, and mobile numbers according to predefined validation rules.

Program Code: -

```
import re

email = input("Enter Email: ")
password = input("Enter Password: ")
mobile = input("Enter Mobile Number: ")

email_pattern = r"^[A-Za-z][A-Za-z0-9._]*@[A-Za-z]+\.(com|org|edu|net|in)$"
password_pattern = r"^(?=.*[A-Z])(?=.*[a-z])(?=.*\d)(?=.*[@#%&!]).{8,}$"
mobile_pattern = r"^[6-9]\d{9}$"

if re.match(email_pattern, email):
    print("Valid Email")
else:
    print("Invalid Email")

if re.match(password_pattern, password):
    print("Strong Password")
```

else:

```
print("Weak Password")
```

if re.match(mobile_pattern, mobile):

```
print("Valid Mobile Number")
```

else:

```
print("Invalid Mobile Number")
```

Sample Input: -

Enter Email: akshya123@gmail.com

Enter Password: Akshya@123

Enter Mobile Number: 9876543210

Output: -

```
File Edit Shell Debug Options Window Help

Result: - Thus, the Regular Expression-based Email, Password, and Mobile Number Validator was successfully implemented and executed.

Section 2: Design a Finite State Automata (FSA) Simulator

2.Problem Statement

Develop a Python-based Deterministic Finite Automata (DFA) simulator.

The program should:

- Accept the DFA description
 - States
 - Input alphabet
 - Transition table
 - Initial state
 - Final state(s)
- Accept multiple input strings.
- Simulate state transitions.
- Display whether the string is Accepted or Rejected.

Example

Language:

Strings ending with "ab"

Input

abaab

Output

Transition Path:

q0 → q1 → q0 → q1 → q2

Accepted

Objective: -

To develop a Python-based Deterministic Finite Automata (DFA) simulator that accepts a DFA description, processes multiple input strings, displays the transition path, and determines whether each string is Accepted or Rejected.

Program Code: -

```
states = ["q0", "q1", "q2"]
alphabet = ["a", "b"]
transition = {
    "q0": {"a": "q1", "b": "q0"},
    "q1": {"a": "q1", "b": "q2"},
    "q2": {"a": "q1", "b": "q0"}
}
initial_state = "q0"
final_states = ["q2"]
n = int(input("Enter number of strings: "))
for i in range(n):
    string = input("Enter string: ")
    current = initial_state
    path = [current]
    for symbol in string:
        current = transition[current][symbol]
        path.append(current)
    print("Transition Path:", " -> ".join(path))
    if current in final_states:
        print("Accepted")
    else:
        print("Rejected")
```

Output: -

```
IDLE Shell 3.14.2

=====
Enter number of strings: 6
Enter string: abab
Transition Path: q0 -> q1 -> q2 -> q1 -> q2
Accepted
Enter string: baba
Transition Path: q0 -> q0 -> q1 -> q2 -> q1
Rejected
Enter string: abba
Transition Path: q0 -> q1 -> q2 -> q0 -> q1
Rejected
Enter string: bbab
Transition Path: q0 -> q0 -> q0 -> q1 -> q2
Accepted
Enter string: baab
Transition Path: q0 -> q0 -> q1 -> q1 -> q2
Accepted
Enter string: baba
Transition Path: q0 -> q0 -> q1 -> q2 -> q1
Rejected
>>>
```

Result: -The Python program successfully implemented a Deterministic Finite Automata (DFA) simulator to process multiple input strings and display their transition paths. The program correctly identified each string as Accepted or Rejected based on the final state.

Section 3: Smart Pattern Matching Engine using Regular Expressions

1.Problem Statement

Develop a Python-based text search engine that performs pattern matching using Regular Expressions.

The system should support:

Word Search

Prefix Search

Suffix Search

Date Search

Phone Number Search

Hashtag Search

Mention (@username) Search

Example Input

Meeting on 12/09/2026

Call 9876543210

#NLP

@OpenAI

natural language processing

User Menu

1.Search Date

2.Search Phone Number

3.Search Hashtag

4.Search Mention

5.Search Prefix

6.Search Suffix

Expected Output

Display all matching patterns based on user selection.

Objective: -To develop a Python-based text search engine using Regular Expressions to perform date, phone number, hashtag, mention, prefix, and suffix pattern matching.

Program: -

```
import re
text = input("Enter Text: ")
while True:
    print("\n1. Search Date")
    print("2. Search Phone Number")
    print("3. Search Hashtag")
    print("4. Search Mention")
    print("5. Search Prefix")
    print("6. Search Suffix")
    print("7. Exit")
    choice = input("Enter your choice: ")
    if choice == "1":
        result = re.findall(r"\b\d{2}/\d{2}/\d{4}\b", text)
        print("Dates Found:", result)
    elif choice == "2":
        result = re.findall(r"\b[6-9]\d{9}\b", text)
        print("Phone Numbers Found:", result)
    elif choice == "3":
        result = re.findall(r"#\w+", text)
        print("Hashtags Found:", result)
    elif choice == "4":
        result = re.findall(r"@ \w+", text)
        print("Mentions Found:", result)
    elif choice == "5":
        prefix = input("Enter Prefix: ")
```

```

result = re.findall(r"\b" + re.escape(prefix) + r"\w*", text, re.IGNORECASE)
print("Prefix Matches:", result)
elif choice == "6":
    suffix = input("Enter Suffix: ")
    result = re.findall(r"\b\w*" + re.escape(suffix) + r"\b", text, re.IGNORECASE)
    print("Suffix Matches:", result)
elif choice == "7":
    print("Exiting...")
    break
else:
    print("Invalid Choice")

```

Output: -

```

```

1. Search Date
2. Search Phone Number
3. Search Hashtag
4. Search Mention
5. Search Prefix
6. Search Suffix

Result: -The Python program successfully performed pattern matching using Regular Expressions for dates, phone numbers, hashtags, mentions, prefixes, and suffixes.

Rubrics for Calculation

Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Problem Understanding	20%	Clearly understands problem constraints, edge cases, and competitive requirements	Understands problem with minor gaps in constraints	Partial understanding; misses key constraints	Misinterprets problem or constraints
Algorithm	25%	Selects optimal algorithm with best time and space complexity for competitive constraints	Uses efficient algorithm with minor scope for improvement	Uses basic/inefficient approach	No clear algorithmic approach
Code Implementation	20%	Writes correct, efficient, and clean code that passes all constraints	Code works with minor errors or inefficiencies	Partially correct code; fails for some cases	Code does not execute or gives incorrect results
Competitive Performance	20%	Solves problem within time limits and handles large inputs effectively	Solves within acceptable time with minor delays	Struggles with time limits or larger inputs	Unable to solve within time constraints
Test Case Handling	15%	Handles all test cases including edge and hidden cases	Handles most test cases	Misses important edge cases	Fails on multiple test cases

Q. No. / Criteria	Problem Understanding	Algorithm	Code Implementation	Competitive Performance	Test Case Handling	Sub. Total	Total %
